Fake stores imitate legitimate shops

Copied pages can persuade shoppers to pay or share personal details with a criminal.

Money lost

Personal details exposed

Familiar cues do not verify the seller

Logo + polished design

A fake store can copy both.

HTTPS

Encrypts the connection.
Does not prove the shop is legitimate.

A reassuring page can still belong to an unverified seller.

A brand name can appear inside someone else's address

brand.example-shop.test

A familiar-looking prefix

"brand" is only a subdomain.

The actual domain

example-shop.test

The name alone proves no brand affiliation. Fictional .test address.

Different evidence deserves different warnings

A newly registered domain

A reason to examine the shop further.

REVIEW

Sensitive fields on an HTTP page

An unencrypted page asks for private details.

HIGH RISK

Meadow uses explicit rules. Missing information stays unknown.

Can the warning arrive before details are entered?

Unsafe checkout

Reveal a sensitive form on HTTP.
Watch the warning become stronger.

A new independent shop

Check whether newness alone triggers a high-risk warning.

First-pass screening cannot prove legitimacy or guarantee delivery.
